How we used AI

LABDSOF 2026/27 · Group G9A · BMC — Building Maintenance Coordinator · Sprint 1 · 1 November 2026

Agents, skills and prompts

- We used AI coding agents (Claude Code, Codex, opencode, T3 Code) and GitHub Copilot.
- One shared instruction file (`AGENTS.md`) gives every agent the same rules: commit and PR conventions, never invent sources or results, and authors never approve their own changes.
- Shared skills in the repository, so each tool works the same way: `labdsof-workflow` (team workflow), `grilling` / `grill-me` (question-by-question design interview), `council` and `sol-loop` (review by other models).
- Prompts were short and tied to a backlog item or issue, and stated the expected output and the rules to follow.

Content creation

- AI helped draft documents, architecture decision records, backlog items, issue and PR descriptions, and diagrams.
- For architecture decisions, a team member first answered a structured design interview; the AI then wrote a first draft from the answers.
- Commits made with AI help carry a co-author line, and AI-assisted drafting is noted in the change logs of the decision records.

Content review

- Most changes went through pull requests, normally reviewed by another team member before merging.
- AI acted as an extra reviewer: Copilot reviews on pull requests, and agents checking consistency, links and sources.
- Review comments, from people or from AI, were answered in the pull request; agreed fixes were made before merging.

How we challenged AI outputs

- The team made the decisions; AI proposals stayed "proposed" until the team reviewed them.
- We checked sources ourselves, cited exact links with access dates, and kept supplier claims apart from what we observed.
- Work drafted with one AI was also reviewed by a different one (Copilot reviews on pull requests), and decision records were revised after those reviews.
- We tested claims instead of trusting them: for example, we ran the agent tools to check that the shared skills actually loaded, which exposed an error in an AI-written file.
- We stated limits openly: simulated interviews are recorded as fictional material, not as real user evidence.
- When an output was wrong or too broad, we asked for changes, cut the scope or rewrote it ourselves.

Evidence is in the repository history: `github.com/Phenriquerafael/LABDSOF_G9A` (commits, pull requests, issues and the project board).
